The North Pole Network wants to see who's the most active in the holiday chat each day....

Question 1: The North Pole Network wants to see who's the most active in the holiday chat each day. Write a query to count how many messages each user sent, then find the most active user(s) each day. If multiple users tie for first place, return all of them.

```
WITH daily_counts AS (  
    SELECT  
        DATE(m.sent_at) AS chat_date,  
        u.user_id,  
        u.user_name,  
        COUNT(m.message_id) AS message_count  
    FROM npn_messages m  
    JOIN npn_users u ON m.sender_id = u.user_id  
    GROUP BY chat_date, u.user_id  
)  
daily_max AS (  
    SELECT  
        chat_date,  
        MAX(message_count) AS max_count  
    FROM daily_counts  
    GROUP BY chat_date  
)  
SELECT  
    d.chat_date,  
    d.user_name,  
    d.message_count  
FROM daily_counts d  
JOIN daily_max m  
    ON d.chat_date = m.chat_date  
    AND d.message_count = m.max_count  
ORDER BY d.chat_date, d.user_name;
```
